

Are you one of millions who suffer from embarrassing spider veins, red spots or redness on your cheeks and nose? Well, there is finally an effective, dependable treatment for your condition—VeinGogh.

Telangectasia is a very common problem that develops from a range of factors, including age, hereditary, lifestyle and diet. These unsightly blemishes can appear on several visible areas including cheeks, chin and nose.

VeinGogh is the newest technology available for treating these benign vascular abnormalities.

How does it work?

The VeinGogh Ohmic Thermolysis System generates a tiny, regulated, high frequency current delivered to the vessel via a hair-thin probe. A “microburst” of energy selectively heats the vein, coagulating the blood and collapsing the vessel wall, which is quickly absorbed into the body. All this is accomplished without affecting the outer layers of the skin resulting in a quick return to normal daily activities.

VeinGogh Ohmic Thermolysis System: superior solution for the treatment of fine telangiectasia, spider veins and small angiomas

- Fast, immediate results
- Consistent, repeatable results, with little or no discomfort
- Treat a wide range of fine vessels, vascular abnormalities and skin tags.
- Clears even recalcitrant vessels left by other therapies
- Treats any skin type
- Usually only a single treatment required
- Resume normal activities right after treatment
